

Enhanced Casement Side Slide - Operation

Ventilation:

There are three stages of ventilation available on the Blairs of Scotland Side Slide. These stages are described in Figures 1 & 2.

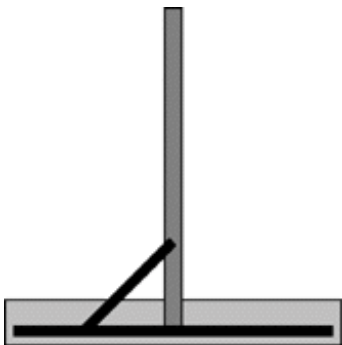

1. *open handles and latch into slot in keeper.*

2. *Open handles and push sash forward until it locates safety restrictor.*

Cleaning:

The hinging mechanism of the Blairs of Scotland Side Slide allows the sash to be reversed for easy cleaning without fouling blinds or curtains. This procedure is straightforward and is described in Fig 3 & 4.

3. *Press release catch on the safety restrictor and push sash forward until it reaches its maximum on the outward position.*

4. *When sash has reached its maximum on the outward position, pull side of sash sideways until it locates in reverse safety catch (cleaning position). Release the reverse position catch by pulling to inside of room and reverse procedure to bring sash back to the closed position.*

Safety:

The window should only be used beyond the safety restrictor for cleaning and Fire Escape.

Maintenance:

- a) When painting in and around windows, care should be taken to ensure no paint covers weather-strip or hardware.
- b) Slight lubrication should be carried out on fittings, when necessary, with acid free oil.
